

# THE NEWSPAPER

15 MARCH 2030

## Kenya Takes 1000 Youth To Mars.

**KENYA BECOMES THE FIRST COUNTRY IN THE WORLD TO  
HAVE IT'S CITIZENS IN MARS FOR INHABITATION.**

This has come to pass after a decade of space exploration, secretly.

Joan Stephen and Milka are the founders of Keys Inc. A company behind this achievement.

"Richard Branson was our inspiration," Milka Said.  
"The crash of Spaceship Two in November 2014 was the epitome of our idea. We had to give our idea a chance." Joan added

Milka and Joan are both in their late twenties. Both share love for planes. As trained pilots, their desire to explore Mars increased as they traveled from one continent to another.

They have visited MARS several times. They took air samples from and to MARS. They wanted to know the best way to have oxygen in the planet. Enough to sustain life.

Milka has a Masters in Enviromental Science. She believed MARS only required a little intervention. She knew there had to be a way. She never left the laboratory for 6years until February 29 2030.

There was breakthrough but she wanted to test it first before giving the information to anyone. She trusted her colleague Joan.

There was breakthrough but she wanted to test it first before giving the information to anyone. She trusted her colleague Joan.

Joan too was busy. She was in the hideouts somewhere working to get a modified rocket that would have a capacity of atleast 200 passengers.

She too had a breakthrough.  
On 15 March 2030 they had a meeting that would change Space exploration forever.

Armed with her specimen Milka embarked on her Journey. They boarded the Kayanski's (Name of the Rocket) for space. She made Five of them.

There are few Press outlets that recorded the take off. It was a new thing so it never caught the eye of Main stream Press. Many thought it was just a Comet.

At the time of this publishing Joan and Milka are yet to give full details of their findings. They are not letting this information go without a fee. Someone got to pay for their hardwork. And we all agree.

Unemployment is the ugly face that Kenya has had to deal with since independence. Poverty has been on the Rise.

These two scientists recruited 1000 Youth. And yesterday they left for MARS. Word has it that Milka got work for them.

She had seedlings for the group. From her findings the soil was very fertile, hence no fertilizers required, atleast for now.

The group will been there for 2 months. The will Till the Land and Build Houses. The tech team was to build a internet infrastructure that would help the hosts communicate better, update their counterparts (in planet Earth) on their progress.

The world is eagerly waiting for their return. Everyone want answers. Joan and Milka has been with the team.

Satellite pictures show their extensive work.

A Group of another 2000 will be leaving in a week's time.

Word has it Joan and her team has denied other countries access to MARS.

They worry Kenya may allocate itself the entire planet, Leaving those that discovered it out.

We patiently wait for their return.

"If you don't find it create it" Joan's response when she was asked about her solution to unemployment.

"My country will not be associated with poverty anymore," Milka said.  
"We are educating our youth".  
Milka added.
