

### **Note on Cyclic Voltammetry**

All performed in dry dimethylformamide with  $\text{NBu}_4\text{BF}_4$  electrolyte at  $100 \text{ mV s}^{-1}$  scan rate, with a platinum working electrode and Ag wire pseudo-reference electrode. The samples all contain a ferrocene internal reference, which appears as a reversible peak with an  $E_{1/2}$  of *ca.* +0.6 V.
