

Data Collection Standardised Procedure

This document outlines the procedures followed when performing the body shape data collection study.

1. Participant is asked to stand in an anatomical position.
2. The participant's height is recorded. Measurement is taken from the top of the head to the ground at their feet.
3. The participant's frontal bust measurement is recorded. This measurement is taken along the front only, as this is indicative of the view seen by a camera.
4. The participant's frontal waist measurement is recorded. This measurement is taken along the front only, as this is indicative of the view seen by a camera.
5. The participant's frontal hip measurement is recorded. This measurement is taken along the front only, as this is indicative of the view seen by a camera.
6. An image of the participant is captured, ensuring the camera captures a full body frontal view of the participant with as little angle as possible to prevent perspective distortion.

All heights recorded in cm
